

Updating the LACE Importer module when it is running as a service.

Before you can update the module, it is essential to stop the service first.

To do this, on the machine running the service (usually your server), press the Windows key & R key to launch the Run dialogue box.

After Open: type **services.msc** and click OK

The Services window will be displayed and you need to locate the **autolace** service.

Click on the service name and options will appear at the left hand side.

[Stop the service](#)
[Pause the service](#)
[Restart the service](#)

Description:

Click [Stop](#) and Windows will stop the service. Minimise this screen as you will return to it.

Update the program from our website from the following URL:-

<http://kesho.co.uk/Files/autolace/autolace.exe>

Once the update has been download and extracted to the appropriate folder, open up the Services area and [Restart](#) the service using the link on the left hand side below the one you used to stop it.

You can close the services window.

Once the service has restarted it will instantly poll for any downloads. It is prudent to check within the \web\ subfolder, within the folder you extracted the update into, to see if there were any errors encountered using the latest build of the importer. If there are any messages immediately added, then please contact the office.
